Explosion-proof INFRARED ANALYZER
EIA-51d/51p
TIA-51d/51p

Explosion-proof THERMAL CONDUCTIVITY ANALYZER
TCA-51d/51p

Explosion-proof MAGNETOPNEUMATIC OXYGEN ANALYZER
MPA-51d/51p

Explosion-proof PARAMAGNETIC OXYGEN ANALYZER
PMA-51d

Advanced technologies that provide safety. An explosion-proof gas analyzer is born.

The 51 series advanced explosion-proof analyzers include HORIBA's extensive experience and specialized know-how to provide the safety, reliability, and accuracy you demand in analyzing flammable gases or operating in explosive environments. To realize the highest levels of safety and operability, the 51 series offers an intuitive interface with a clearly visible display. The analyzers' long term reliability and your confidence are ensured by full compatibility with IEC 60079 standards. The extensive line-up for the 51 series covers a wide range of applications including infrared gas analyzers for general-purpose processes and models for use with oxygen and hydrogen. The HORIBA 51 series meets your gas analysis needs in environments where safety, reliability, and accuracy are always your priorities.

New designs and unique concepts define the next generation of standards

Focused on functionality

- ***Meets diverse gas analysis requirements***
- ***Offers a clearly visible and easy-to-operate user interface***
- ***Compatible with IEC 60079 standards and communication functions***

Hydrogen explosion-proof models

Building on the HORIBA legacy of safety, reliability, and accuracy of the 31 series, the new 51 series enhances explosion-proof specs to the level of ⅡB + H_2.

Flameproof enclosures

Ex d ⅡB+H_2 T4

- T4 — **Temperature class** T4: 135℃ (Max surface temperature)
- ⅡB+H_2 — **Group of electrical apparatus** ⅡB+H_2: Apply to flammable gases of group ⅡB and H_2
- d — **Type of explosion** d: Flame proof enclosures
- Ex — **According to standard (IEC 60079)**

Pressurized apparatus

Ex px Ⅱ T4 X

- X — **Specific conditions.***
- T4 — **Temperature class** T4: 135℃ (Max surface temperature)
- Ⅱ — **Group of electrical apparatus** Ⅱ: Apply to flammable gases of group Ⅱ
- px — **Type of protection** px: Pressurized apparatus, Type px
- Ex — **According to standard (IEC 60079)**

Ex pxd ⅡC T4 X

- X — **Specific conditions.***
- T4 — **Temperature class** T4: 135℃ (Max surface temperature)
- ⅡC — **Group of electrical apparatus** ⅡC: Apply to flammable gases of group ⅡC
- pxd — **Type of protection** px: Pressurized apparatus, Type px (apparatus) d: Flame proof enclosures (sensor)
- Ex — **According to standard (IEC 60079)**

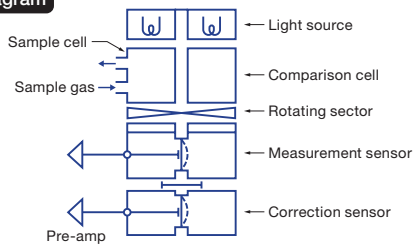
*The apparatus pressurized internally is 50 Pa higher than measuring gas pressure.

Principle

EIA-51d/51p·TIA-51d/51p

■Non-dispersive infrared (NDIR) analyzer (interference correction type)

Conceptual diagram



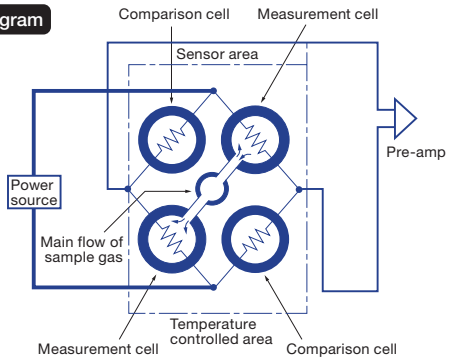
Measurement principle

"Interference correction" is an original method based on NDIR analysis that ensures extremely high accuracy even in the case of samples containing large amounts of interfering compounds.
The interference correction combines a measurement sensor with a correction sensor positioned in parallel in the same optical path. This significantly reduces the effects of:
- interfering gases in the sample gas;
- vibrations and other external disturbances; and
- drift resulting from deterioration of the light source and cell components.

TCA-51d/51p

■Heat conductivity type

Conceptual diagram



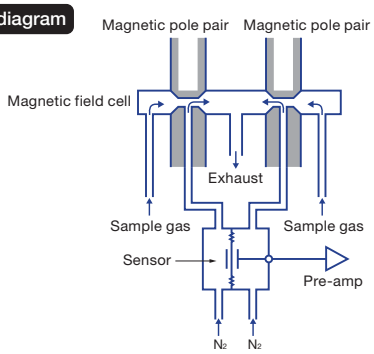
Measurement principle

Gas concentration is measured using the differences in heat conductivity unique to specific gases. The sensor area forms a Wheatstone bridge using measurement cells and comparison cells containing hot wires made from platinum and other materials. The sample gas flows into the measurement cell as a result of diffusion, and a base gas (generally nitrogen or air) is sealed inside the comparison cell.
The hot wires are heated by a constant current. If the sample gas contains a gas with a heat conductivity differing from that of the standard gas in the comparison cell, then the temperature of the hot wires on the measurement side changes, and this in turn changes the resistance depending on the composition of the sample gas. This change in resistance is converted into a concentration signal for the gas being measured, based on the change in the unbalanced voltage of the Wheatstone bridge.

MPA-51d/51p

■Magnetic pressure analyzer (pressure sensor / magnetic force type)

Conceptual diagram



Measurement principle

Because oxygen has extremely strong paramagnetic characteristics, if there is any oxygen in a heterogeneous magnetic field, then the oxygen is drawn toward the stronger magnetic field, and the pressure in that area changes (increases).
The change in pressure is represented by the following formula.

$\Delta p = 1/2H^2 \times X \times C$

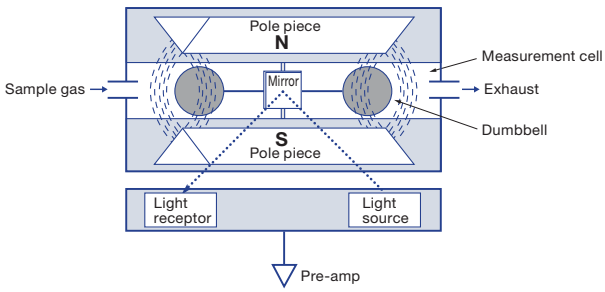
Δp: change in pressure; H: Strength of magnetic field; X: Magnetic susceptibility of paramagnetic gas; C: Temperature of paramagnetic gas

This pressure increase is drawn out of the magnetic field using a non-magnetic comparison gas (nitrogen), and the pressure change is detected by a sensor and converted into an electrical signal. The electromagnets are excited alternately to derive and transmit a stable signal, which is processed as an alternating signal. For this reason, if there is no oxygen in the sample gas, the signal is zero, so there is no zero drift, and the signal remains extremely stable over long periods of time. Furthermore, the output is linear in reference to the oxygen concentration, so concentration can be measured across a very broad range.

PMA-51d

■Magnetic dumbbell (dumbbell-shaped magnet type)

Conceptual diagram



Measurement principle

Because oxygen has extremely strong paramagnetic characteristics, if there is any oxygen in a heterogeneous magnetic field, then the oxygen is drawn toward the stronger magnetic field.
In the sensor area, a glass dumbbell with a mirror attached is hung horizontally using platinum wires. When oxygen passes through the sensor area, the dumbbell is pushed out by the magnetic field effects described above.
The change in pressure is represented by the following formula.

$F = (X1 - X2) \times V \times H$

F: Force acting on the dumbbell; X1: Magnetic susceptibility of the dumbbell; X2: Magnetic susceptibility of the surrounding gas; V: Volume of the test body; H: Strength of the magnetic field

As the dumbbell rotates, the position of the reflected light reaching the photocell (the light receptor) changes. Reverse torque is then added to the dumbbell through a feedback system to return the dumbbell to its original position.
Because this torque is linear in reference to the oxygen concentration, the torque value is output as the oxygen concentration.

■Specification

Model			EIA-51d	EIA-51p	TIA-51d	TIA-51p
Type of protection			Exd Ⅱ B+H_2T4	Expx Ⅱ T4X	Exd Ⅱ B+H_2T4	Expx Ⅱ T4X

IMS

The HORIBA Group adopts IMS (Integrated Management System) which integrates Quality Management System ISO9001, Environmental Management System ISO14001, and Occupational Health and Safety Management System OHSAS18001.
We have now integrated Business Continuity Management System ISO22301 in order to provide our products and services in a stable manner, even in emergencies.

Please read the operation manual before using this product to assure safe and proper handling of the product.
